

Francesc Salla - Lands Design: landscaping design tools for Rhino.

Lands Design is software for designing gardens and green spaces in Rhino.

In this workshop you will learn the main Lands Design tools that will guide you through a landscaping project design for producing 2D technical drawings, create 3D models and render views.

The workshop will cover the following topics:

1. Work with plant species: insert trees, shrubs, parterres, and arrange them in rows, forests, etc...
2. Plant database: Edit, customize and create new plant species.
3. Civil work: create object rows, fences, paths, hedges, etc...
4. Terrain modelling tools: create terrains from contours, curves, point clouds or imported from Google Earth. Tools to edit terrains: apply cut and fills, hollows, insert paths, etc..
5. Project 2D documentation: Generate setting out plans and project information: 2D plans and lists to quantify species and the project information.
6. Rendering tips.
